ComSci 2

I. Project Title

CompuThank: A Python Program that Computes Student's Average Grades

II. Problem Statement

- When computing grades, especially during Grading Season, teachers have a hard time computing, especially if they don't have calculators. CompuThank is a python program that helps teachers, and maybe even students, to compute the final average of a student's grade.

III. Project Objectives

1. To create a simple program that will easily help teachers and students to compute grades.
2. To help teachers and students to automatically compute the average grade.
3. To check whether the student passed or failed.

IV. Planned Features

1. Enter a student's grade in each subject.
2. Automatically calculate the average grade.
3. Show the computed average.
4. Show whether the student passed or failed based on the grading system.

V. Planned Inputs and Outputs

INPUT	OUTPUT
• Students grade in different subjects.	• Average grade in those subjects.
• Number of subjects.	• Sum of all individual subject average grades.
• Calculation of average grade.	• Student's status whether "Passed" or "Failed".

VI. Logic Plan

Start

Ask for grades in each subject.

Add all grades

Count number of subjects being taken

Divide the total number of grades to the number of subjects in order to get the Average grade.

Display/Show the Average Grade

IF the average is 75 or higher:

Display "Passed"

ELSE:

Display "Failed"

End
